A story worth telling:

Mrs. Smith, 65, had worn full dentures for about 10 years. She lost her teeth due to gum disease and decay at an early age and was given full dentures. She remembers when she first got the dentures: "Big, clonky pieces of plastic which were really tough to get used to. It caused me to gag a lot, and the best I could eat was mashed potatoes and puree apples. It never really fit well, so I started getting sore spots all the time. My dentist tried to reline them a few times, but it would only remain comfortable for a short time. Over the next several years, I had to get more relines as the dentures seemed to have less hold on my jaw bone. Dentures got thicker and heavier and would slip all the time. It was not till recently that I realized my jaw bone was gradually melting away from the pressure of dentures on my gums. I tried using denture glues, but didn’t really work well and I was spending a lot of money. The denture is so loose now that I can not keep it in place, even during normal talking. It’s really embarrassing. I like to go out a lot and spend time with family and friends. And like to also eat. But just can’t. It’s just horrible."

Mrs. Smith had two dental implants placed, a 30-minute procedure under IV sedation, and was allowed to heal for 6 weeks before a new overdenture was made for her. It has attachments that fit over the implants and snaps into place. She has been using the new prosthesis for about a year and is very pleased and happy with it. She is social again and enjoying her favorite foods. She is saving money by not having to buy denture adhesives.

Stories like this are not uncommon. People are living longer and healthier lives and dentures aren’t compatible with an active and healthy lifestyle. In addition, denture-wearers may have problem getting proper nutrition. But you don’t have to put up with dentures. There are better solutions.
Many thoughts may be running through your head. What are my prosthetic choices? Can I get a fixed denture that does not come out? What will I be able to eat? Does it look natural? What is the ‘Teeth-In-A-Day’ concept? Do I have enough bone for implants? How many implants do I need? How long do I have to wait before my new prosthesis? What do I use while implants are healing? Am I too old for implants? Does it hurt? How much is it? Here are some answers and information to help you make a better decision.

What is the problem with conventional dentures?

When all of your teeth are missing, the jaws deteriorate rapidly. In addition, as the bone melts away, your muscles migrate, or pull back from their natural position. Your lips cave in as they lose support and wrinkles increase dramatically as your facial structures collapse. Complete tooth loss and the deterioration of the jaws can also result in significant overall health problems related to improper digestion and malnutrition.

If you replace your missing teeth with dentures, you are compromising your facial structures. Dentures accelerate the bone resorption process as they put pressure on and compact the gums and underlying bone. As facial structures continue to collapse, the dentures must be relined (made thicker) to compensate for additional bone loss. Replacing your teeth with implant supported overdentures (or bridges) will preserve the bone and prevent the further deterioration of facial structures and the related health problems that would normally occur with complete tooth loss.

My dentures are loose and I cannot eat well. What are my choices?

Dentures cause irreversible loss of jaw bone over time, and become increasingly loose and difficult to chew with. Frequent relines and expensive adhesives do not improve the condition, which progressively gets worse. The best alternative is dental implants to support either a removable denture (known as overdenture) or a fixed denture (hybrid prosthesis or bridge). Even the simplest design can improve your denture retention, eating, and self-confidence dramatically.

Can I get a fixed denture that does not come out?

Absolutely. Many people do not like removable dentures and find it quite embarrassing. With dental implants, you can have a fixed prosthesis that cannot be removed by you. It resembles natural teeth and is quite comfortable. Depending on the particular design, four to eight implants are necessary for a fixed prosthesis.

What kind of foods can I eat afterward?

Patients report significant improvements in their chewing ability and diet. You can eat steaks, apples, corn on the cob, and other foods that are practically impossible to eat with conventional dentures.
What is ‘Teeth-In-A-Day’ that I hear advertised?

This has become a new craze, and yes, I believe, it’s largely a marketing fad. Teeth-In-A-Day means you have your teeth removed, implants placed, and receive crowns, bridges, or dentures all in one day. Here is the catch: While promising, the current science, knowledge, literature, research, and expertise are not sufficient to achieve predictable results. The approach may be successful, but only in very few candidates who present with no infection around their teeth, have a great amount of bone, and all conditions are ideal. If conditions were this perfect, why would they need to have their teeth extracted to begin with? Many commercial “implant centers” do a hard sell to fit a patient into a treatment plan. Healthy natural teeth end up being extracted in order to place multiple implants and connect them with an immediate prosthesis on the same day! There are some evidence-based studies on this approach, but there are too many variables not yet thoroughly understood. Use of this approach in poor candidates results in high rates of failure and implant loss.

How many implants do I need?

The number of implants depends on whether you want to have a fixed or a removable prosthesis:

- **Two Implants:** Simplest and minimum number of implants for support of an overdenture. You will have great denture retention and can eat quite comfortably.

- **Four Implants:** Provides better support for your removable overdenture. Having four implants allows less denture extension or flanges and increases comfort dramatically. In some cases, a fixed prosthesis may be possible with four implants.

Do I have enough bone for implants?

Sufficient bone is important for the long-term success of dental implants. During examination, Dr. Kazemi will evaluate the amount of bone you have. Various X-rays such as a panorex or CT-scan may be needed for proper diagnosis and treatment planning. Implants for lower overdenture are usually placed in the front part of the jaw where there is usually adequate bone, even in severe cases of resorption.

The upper jaw bone may require bone augmentation depending on the number and location of the implants. A good clinical evaluation, along with appropriate X-rays or CT-scan will tell whether you have enough bone to support implants.

3-D images from CT-Scan demonstrates amount of bone present for implant support.
• **Five-Six Implants:** Ideal for a fixed-hybrid prosthesis. This is an overdenture that has metal sub-structure and is fixated to the implants. The prosthesis can be removed only by your dentist, if necessary. This eliminates denture extensions or flanges and feels more natural.

• **Eight Implants:** Indicated for a fixed bridge. This prosthesis is made of porcelain or other ceramics and is supported by implants via screws or cement.

---

**Am I too old for implants?**

Some older patients fear their jaw bone is too weak for implants. The fact is, dental implants are equally successful and have excellent prognosis in older patients. There is no age limit for dental implants and for many, improved chewing, teeth stability, and self-confidence adds quality to their lives.

**Can I get implants with my osteoporosis condition?**

Absolutely. Osteoporosis does not effect the health of the jaw bone. Dental implants are equally effective and successful.

**Can dental implants be rejected?**

Rejection does not occur with dental implants. The overall success rate for dental implants is 98 percent with almost 50 years of clinical research to back them up. Because implants are made of completely biologically compatible “bone-friendly” titanium material, they naturally heal and integrate with the surrounding tissues.

**Who is the right dentist for implant treatment?**

Teeth replacement with dental implants require collaborative efforts of a surgeon and a restorative dentist and dental laboratory. Dental implant surgery is a highly skilled discipline, best performed by oral surgeons who are well trained and perform this procedure daily. Dr. Kazemi specializes in dental implant placement and has performed it successfully on thousands of patients. The prosthetic aspect (crown, bridge, etc) is performed by your restorative dentist who may be a general dentist or a prosthodontist, a specialist trained in more complex aesthetic and reconstructive restorative dentistry.

---

**How long after surgery can I get my new teeth?**

A prosthesis can be delivered on the same day, as an immediate denture, or in two to three months after proper healing. While the implants are healing, you may use your current denture.

**Can I have my teeth extracted and implants placed on the same day?**

Yes, it is possible, however, it depends on the health of the extraction sites, integrity of the surrounding bone, and location of implants. Immediate implant placement shortens the overall treatment time and consolidates your procedures into one. However, it is done with caution and only in selected patients who meet strict criteria.
Are teeth extractions, grafting, and implants safe?

Extractions, grafting, and implants are quite safe and predictable, and complications can be avoided when performed by a trained, skillful, and experienced oral surgeon using specialized instruments and techniques. Dr. Kazemi specializes in these procedures and has performed them successfully on thousands of patients. The office is designed and equipped for such surgical procedures, and the team assisting Dr. Kazemi is trained specifically for them. Methodical, exacting, and detailed protocols are followed strictly to make sure every patient is safe and having a remarkable experience.

Dental implants are made of completely biologically compatible “bone-friendly” titanium material, that naturally heal and integrate with the surrounding tissues. Because titanium is accepted so well by the human body, it is also used for orthopedic implants such as hip and knee replacements.

What is the best anesthesia option and how safe is it?

The best way to manage anxiety and make sure you have the best possible experience is to opt for IV sedation. It is the most recommended and chosen by many patients. Dr. Kazemi is trained and licensed in administering office anesthesia. Its safety is attributed to continued monitoring techniques, the short-acting nature of the medications, availability of emergency equipment, and most importantly proper training of the surgeon and the staff. Other options are local anesthesia, with or without nitrous oxide (laughing gas) but patient is completely awake and fully aware of the procedure.

IV sedation is very safe and predictable in healthy patients when administered by an experienced clinician with proper training and accepted protocol. The patient is continually monitored during anesthesia and emergency equipment is on hand, if necessary. The medications used have a long history of safety and are short-acting. Anesthesia is also safe in patients with respiratory problems or cardiovascular disease, providing that precautions are taken. To avoid possible airway compromise, patients with severe upper respiratory compromise, such as severe cold with stuffy nose and productive cough are asked to postpone the surgery until they feel better.

The facility is equipped with emergency equipment and medications and the entire team is trained to manage any possible complications quickly and properly. The surgeon is CPR and ACLS certified and can manage any complications that arise effectively and quickly. Suburban Hospital is in close proximity in the event additional assistance is required.

How soon can I return to normal activities?

Most patients return to normal activities one to two days after the procedure. There is no problem with traveling or flying the following day, although it’s best to rest for a day or two. Of course, there are always variations in overall response and recovery.
What is the expected recovery?

- **Pain:** Level and duration of pain depends on the complexity of the surgery, technique, and patient’s tolerance. Pain associated with dental implants is extremely low, sometimes requiring no pain medications. Some may experience three to four days of discomfort, commonly managed with pain medications such as Advil, Tylenol #3 or Vicodin. As pain gradually diminishes over the next two to three days, Ibuprofen (Advil) or Acetaminophen (Tylenol) can be used. After seven to ten days, most patients no longer have pain and may stop their medications.

- **Swelling:** Any swelling related to surgery will maximize in 36 to 48 hours following procedure, and gradually taper over the next five to seven days. Ice helps to reduce swelling in the first 24 hours.

- **Diet:** Upon arrival home, patients may have water, juices, soups, shakes, puree, and very soft food. A soft diet is recommended up to five to seven days. No hard, crispy, or spicy foods should be eaten during this period. The general rule is if you have to chew, it’s probably too hard. After seven days, patients may gradually return to normal food.

- **Activity:** Get plenty of rest on the day of surgery. Some patients may feel well enough the following day to walk and go out. That’s all right, but take it easy. Avoid strenuous activities for the first two to three days. Refrain from sports, lifting, or doing anything that requires exertion. After three days, if patients feel more comfortable, they can walk, go for a gentle swim, or do very low-impact exercise. Mild activities may cause some pain but not enough to disturb the surgery site or open the sutures.

Managing your anxiety:

Anxiety is not uncommon among people having oral surgery. This anxiety is mostly related to hearing of others’ bad experiences with excessive pain, swelling, and complications. We resolve this in several ways. First, the use of IV sedation allows patients to nap during the surgery. This helps greatly to make them comfortable and reduce anxiety. Second, patients will be cared for by a group of affable staff members who take time to personally connect with each patient and allay their fears and concerns. Third, the surgery is done conservatively, which minimizes or avoids swelling, pain, and complications.
Planning Your Visit

Planning the procedure around your schedule:

We understand that taking time off work or other responsibilities may be challenging. Therefore, we will arrange your appointments in a way that offers efficiency and minimizes your time spent in our office. For dental implants, we recommend first a consultation appointment. During this visit, we will complete the examination, take necessary diagnostic X-rays, discuss treatment options, and various stages. Our financial coordinator will meet with you to discuss fees and payment options. Following the procedure, you may have one or two follow up appointments. As a convenience, prescriptions are available right in our office. We offer a flexible appointment schedule, Monday through Friday between the hours of eight and five, and early-morning or late-day appointments per special arrangements. Weekend appointments are available for our VIP and presidential service packages and can be reserved per special arrangements.

What your escort can do during your procedure?

Your loved ones can relax in our lounge and enjoy a cup of tea or coffee and read a wide selection of magazines. Or take advantage of our free Wi-Fi computer lounge to check emails and browse the internet on either your computer or ours. They may also take a stroll on convenient Bethesda Avenue and visit the many stores, coffee shops, and restaurants. We’ll call them when procedure is complete so they can return to office and join you in the recovery room.

Necessary information prior to the procedure:

- Patient registration form, medical history, signed HIPAA forms. All forms may be completed online or sent by fax prior to your visit.
- Referral form from your dentist indicating the planned areas for implant placement.
- Panoramic X-ray done within the past six months. Your dentist may send it to us electronically or give you the film to bring. If you don’t have a panoramic X-ray, you can obtain one in our office. If a CT-scan is necessary, we will refer you to a nearby center.

What is the cost, payment options, and insurance protocol?

The cost of surgery depends on the number of implants, grafting needs, and your choice of anesthesia. Once you have been examined and the treatment plan completed, the exact cost will be discussed. Biopsy procedures maybe considered under either dental or medical insurance. We have several payment options including short- and long-term plans. Those with insurance may choose to pay the surgical fees and receive reimbursement directly from their insurance company, or pay an approximate co-pay and we will submit the necessary claims. If you need special financial assistance to prepare for your desired procedures, a separate consultation appointment is recommended.
About Dr. H. Ryan Kazemi

Dr. H. Ryan Kazemi is an oral and maxillofacial surgeon certified by the American Board of Oral and Maxillofacial Surgeons. He received his dental degree from the University of Pennsylvania, School of Dental Medicine in 1990. Following a one year internship at the Albert Einstein Medical Center in Philadelphia, he pursued surgical training at The Washington Hospital Center in Washington, DC, where he received his certificate in Oral and Maxillofacial Surgery. Dr. Kazemi has practiced in Bethesda, Maryland since 1997, providing a full spectrum of oral and maxillofacial surgery procedures with emphasis on extractions, dental implants, bone grafting, and corrective jaw surgery.

Dr. Kazemi is a diplomat of the American Board of Oral and Maxillofacial Surgeons, and an active member of the American Association of Oral and Maxillofacial Surgeons, American College of Oral and Maxillofacial Surgery, Academy of Osseointegration, American Dental Association and Entrepreneur Organization.

He has served as the founder and president of several dental and implant study clubs in the Washington DC area. Dr. Kazemi has published and lectured extensively on dental implants, bone grafting, and practice management. His newsletter, To-The-Point, is read by more than 2000 dentists every month. He is also the founder of DDSForums.com, a professional networking site for dentists.

Dr. Kazemi serves on the medical staff for D.C. United, the major league soccer team in Washington, D.C. and the US National soccer team for the care of their athletes.

Our expertise and service allow you to:

• Be treated by a specialty trained and skilled doctor
• Achieve the results you expect
• Have a speedy recovery
• Make appointments easily and efficiently
• Be seen quickly and on time
• Feel safe and comfortable
• Experience a warm and personal service

Experience oral surgery care that…
Patients talk about
Referring doctors brag about
And our team delivers everyday
